Improve the world

The graph below shows that, thanks to good insulation, gas consumption decreased by more than a half: .

The following should be noted here.

For 2009 there was an old-fashioned fireplace in which around 1 m³ of wood was burned per year.

After 2009 this fireplace was replaced by a more efficient fireplace with a fan, which means that much less heat is lost. After 2009, approximately 2 to 3 m³ of wood were burned per year.

Gas consumption (m³) in the period 2000-2016

Note: the insulation activities started in 2009
